TRW-24HP-N RF MODULE

Wireless 2.4GHz 500mW Transceiver RF Module

Version History

Version	Date	Changes
V1.0	Feb. 22, 2012	1 ^{st.} Edition

WENSHING **TRW-24HP-N** wireless 2.4GHz high power transceiver RF module is designed, developed and manufactured as contemplated for general use, without limitation, ordinary industrial use, general office use, personal use, and household use, but is not designed, developed and manufactured as contemplated

- (1) For use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system).
- (2) For use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

You shall not use this product for the above-mentioned using.

If your equipment is likely to be used for the above-mentioned uses, please consult with our sales representative before using.

WENSHING Component Division shall not be liable against you and/or any third party for any claims or damages arising

in connection with the above-mentioned uses of this product.

Function Introduction

- TRW-24HP-N wireless 2.4GHz High power transceiver RF module is a frequency agile, half duplex.
- Transceiver is with SPI bus interface.
- Direct microprocessor
- Connection for control and data transfer eliminates.
- Needs for additional ICs, while integrated data code/decode hardware.
- Reduces the instruction set requirements on the associated microprocessor.
- Adjustable data rate, filter bandwidths and detection.
- Levels allow the IC to be used in a wide variety of high sensitivity/ High EMI environments. The TRW-24HP-N is ideally suitable for use in battery powered wireless applications in conjunction with Microprocessors for data communication.

Application

- Security System
- 2.4 GHz Cordless Phones
- Wireless Remote Control Car
- Wireless Remote Control Robot
- Automatic Power Switch Control
- Wireless Modem

Specification

- Frequency Range: 2.400GHz~2.4835GHz
- GFSK modulation
- Output Power: 23±1dbm (5V)
- Data Rates: from 1 to 2M bits/Sec
- Low Working Voltage: 3.7V~5.5V
- Input sensitivity: -95dBm(1MBPS)
- 3 separate 32 bytes TX and RX FIFOs
- Automatic Packet Handling
- RF Channels: 126
- Built-in Antenna connector
- RoHS Compliant

Dovomotov	Specification			Unit	Condition	
Parameter	Min	Type	Max	Onit	Condition	
Frequency Range	2.4		2.4835	GHz		
Receiver Sensitivity	-98		-91	dBm	1Mbps	
Data Rate	1		2	M Bit	GFSK	
Supply Voltage, VDD	3.7		5.5	V	DC	
TX Current		300		mA		
RX Current				mA		
Power down Current		1		uA	Power down Mode	
standby-I mode Current		26		uA	standby-I mode	
standby-II mode Current		360		uA	standby-II mode	
Disable Current				uA	Enable PIN is LO	
Power up time			100	ms	Disable to Enable time	
Operating Temperature	-20		+70	°C

Pin Assignment

Pin	Name	I/O	Description
1	Antenna	I/O	RF output to the antenna
2	VDD	POWER	Power Supply 3.7~5.5V
3	VDD	POWER	Power Supply 3.7~5.5V
4	GND	Ground	Ground
5	GND	Ground	Ground
6	ENABLE	I	Full power down 0 = full power down mode 1 = normal mode
7	CE	I	Chip Enable Activates RX or TX mode
8	CNS	I	SPI Chip Select
9	SCK	I	SPI Clock
10	MOSI	I	SPI Slave Data Input
11	MISO	0	SPI Slave Data Output
12	IRQ	0	Mask able interrupt pin. Active low
13	RF GND		RF Ground

Power Management

TRW-24HP-N has a IC regulator, external input power supply can be 3.7~5.5V input. When ENABLE Pin is on OL, module will not waste power. SPI interface can also declare a few powers saving mode:

Power down Mode

Communicating thought SPI interface set PWR_UP REGISTER BIT to 0 in the module.

• Standby -I Mode

When set PWR_UP REGISTER BIT to 1, it enters Standby Mode. At the moment, the module's Crystal oscillation and wait for the next commend. This can shorten RF's start-up time during operation.

Standby –II Mode

After setting PWR_UP REGISTER BIT to 1, Set Module's CE PIN to high potential. At the moment, FIFO data start to transmit, Module's PLL starts operating.

SPI Communication

When MCU read REGISTER from RF Module, the diagram below is timing diagram. The first few bits are LO during read, because REGISTE address is not over 32. The writ method: When MCU is writing to RF Module, the fifth bit must be 1 to allow write.

SPI Read Timing diagram

SPI Write Timing diagram

SPI write operation

REGISTER Description

Note: Register address 18H to 1BH is module testing sample, please to not use.

Address			Reset	Read/Write	ing sample,please to not use.

Enhanced ShockBurst™ Transmitting Payload

- 1. The configuration bit PRIM_RX has to be low.
- 2. When the application MCU has data to transmit, the address for the receiving node (TX_ADDR) and payload data (TX_PLD) has to be clocked into nRF24L01 through the SPI. The width of TXpayload is counted from number of bytes written into the TX FIFO from the MCU. TX_PLD must be written continuously while holding CSN low. TX_ADDR does not have to be rewritten if it is unchanged from last transmit. If the PTX device shall receive acknowledge, data pipe 0 has to be configured to receive the ACK packet. The RX address for data pipe 0 (RX_ADDR_P0) has to be equal to the TX address (TX_ADDR) in the PTX device. For the example in Figure 1

the following address settings have to be performed for the TX5 device and the RX device:

TX5 device: TX_ADDR = 0xB3B4B5B605

TX5 device: RX_ADDR_P0 = 0xB3B4B5B605

RX device: RX ADDR P5 = 0xB3B4B5B605

- 3. A high pulse on **CE** starts the transmission. The minimum pulse width on CE is 10µs.
- 4. nRF24L01 ShockBurst™:
 - Radio is powered up.
 - □ 16MHz internal clock is started.
 - RF packet is completed (see the packet description).
 - Data is transmitted at high speed (1Mbps or 2Mbps configured by MCU).
- 5. If auto acknowledgement is activated (ENAA_P0=1) the radio goes into RX mode immediately, unless the NO_ACK bit is set in the received packet. If a valid packet has been received in the valid acknowledgement time window, the transmission is considered a success. The TX_DS bit in the STATUS register is set high and the payload is removed from TX FIFO. If a valid ACK packet is not received in the specified time window, the payload is retransmitted (if auto retransmit is enabled). If the auto retransmit counter (ARC_CNT) exceeds the programmed maximum limit (ARC), the MAX_RT bit in the STATUS register is set high. The payload in TX FIFO is NOT removed. The IRQ pin is active when MAX_RT or TX_DS is high. To turn off the IRQ pin, the interrupt source must be reset by writing to the STATUS register (see Interrupt chapter). If no ACK packet is received for a packet after the maximum number of retransmits, no further packets can be transmitted before the MAX_RT interrupt is cleared. The packet loss counter (PLOS_CNT) is incremented at each MAX_RT interrupt. That is, ARC_CNT counts the number of retransmits that was required to get a single packet through. PLOS_CNT counts the number of packets that did not get through after maximum number of retransmits.
- 6. nRF24L01 goes into standby-I mode if **CE** is low. Otherwise next payload in TX FIFO is transmitted. If TX FIFO is empty and **CE** is still high, nRF24L01 enters standby-II mode.
- 7. If nRF24L01 is in standby-II mode, it goes to standby-I mode immediately if **CE** is set low.

Enhanced ShockBurst™ Receive Payload

- 1. RX is selected by setting the PRIM_RX bit in the CONFIG register to high. All data pipes that receive data must be enabled (EN_RXADDR register), auto acknowledgement for all pipes running Enhanced ShockBurst™ has to be enabled (EN_AA register), and the correct payload widths must be set (RX_PW_Px registers). Addresses have to be set up as described in item 2 in the Enhanced ShockBurst™ transmit payload chapter above.
- 2. Active RX mode is started by setting CE high.
- 3. After 130µs nRF24L01 is monitoring the air for incoming communication.
- 4. When a valid packet has been received (matching address and correct CRC), the payload is stored in the RX-FIFO, and the RX_DR bit in STATUS register is set high. The IRQ pin is active Revision 2.0 Page 66 of 74 when RX_DR is high. RX_P_NO in STATUS register indicates what data pipe the payload has been received in.
- 5. If auto acknowledgement is enabled, an ACK packet is transmitted back, unless the NO_ACK bit is set in the received packet. If there is a payload in the TX_PLD FIFO, this payload is added to the ACK packet.
- 6. MCU sets the **CE** pin low to enter standby-I mode (low current mode).
- 7. MCU can clock out the payload data at a suitable rate through the SPI.
- 8. nRF24L01 is now ready for entering TX or RX mode or power down mode.

State Diagram

Radio control state diagram

Communication Example 1: When transferring date to 2.4GHz, the Length is XX; REGISTER is shown from table below:

Address	00	01	02	03	04	05	06	07
Data								
Address	08	09	0A	0B	0C	0D	0E	OF
Data								9
Address	10	11	12	13	14	15	16	17
Data								
Address	18	19	1A	1B	1C	1D		
Data								

Timing of Enhanced ShockBurst™ for one packet upload (2Mbps)

Communication Example 2: When transferring date to 2.4GHz, the Length is XX; REGISTER is shown from table below:

Address	00	01	02	03	04	05	06	07
Data								
Address	08	09	0A	0B	0C	0D	0E	0F

Output Power

Layout Notes

 It should be to add several big capacitors before power on to increase stable RF communication.

- It should not run digital signal at end of module to avoid EMI transmitted to RF module.
- Module add external antenna, the bottom part of the PCB antenna should be as much as possible to provide non- copper park area for the antenna radiation use.
- Please notice, if you used termial inside the module to connect with external antenna, ANT PIN & RF GND PIN don't solder on PCB.
